RandNum

This program introduces a random number generator in C++. Make a box in the center of your screen. Don't ask the user for the parameters of the box. You decide what they should be and set them in your program. Write a random number at the center of the box. Enter any key (except 'q') to get another random number. Repeat this until you enter 'q' (for quit). Then the program should end.

A sample output for this program is:

```
%%%%
%    %
%    %
%    %
% 8  %
%    %
%    %
%%%%%
```

enter 'q' to quit or any other key to get another random number:
